THE CRESSON TYPES OF HYMENOPTERA

BY EZRA TOWNSEND CRESSON

This paper contains a complete list of the species of Hymenoptera described by the author, arranged alphabetically under each family, with reference to the original description, sex, number of the type-specimen, as recorded in the catalogue of types in the collection of the American Entomological Society, locality and condition of the specimens as found during the winter of 1913-14; and as the collections are carefully looked after, there is likely no change in their condition at the time of the publication of this paper.

In selecting the single type the author has been governed by the present condition of the original material, and has always selected the perfect, or more nearly perfect specimen.

No notice has been taken of synonymy; the genera, given in parenthesis, after the species, being those under which they were originally described.

Unless otherwise stated, the type-specimens are in the Collection of the American Entomological Society, at the Academy of Natural Sciences, Philadelphia, Pa.

The Belfrage Collection is in the United States National Museum, Washington, D. C., and the author is greatly indebted to Mr. J. C. Crawford and Mr. S. A. Rohwer for data as to type numbers, and condition of the specimens as found by them in August, 1914.

It is the firm recollection of the author that after all the unique specimens had been described and returned to Mr. Belfrage, as he requested they should be, that gentleman, finding a duplicate in his collection of what he considered to be the same species, very generously returned the type-specimen to the Society, after the publication of "Hymenoptera Texana." There are only nine in this category, and reference thereto is made under each of the species in its proper place in this catalogue. The same may be said of Mr. Gundlach, after the publication of "The Hymenoptera of Cuba" in 1865.

The Gundlach Collection of Hymenoptera is in the Museum of the "Instituto de Segunda Enseñanza de la Habana," Obispo Street, Havana, Cuba. Dr. Henry Skinner, Curator of the American Entomological Society, who visited the Museum in 1913, found the collection arranged in thirteen hermetically sealed, glass-top boxes. The specimens appeared to be in good condition, but that of the type-specimens themselves could not be accurately ascertained, although an effort was made to obtain the information.

The Boll Collection is in the Museum of Comparative Zoology, Cambridge, Mass., and Dr. Samuel Henshaw very kindly furnished recent data regarding the types in that collection.

The type-specimens described from the Norton Collection appear to be lost, except a few now in the collection at the Academy of Natural Sciences, Philadelphia, Pa.

In conclusion, the author desires to express his thanks to Dr. Henry Skinner and Mr. E. T. Cresson, Jr., in charge of the Entomological collections at said Academy, for valuable aid given in the preparation of this catalogue.

Types of 2737 species are given in the following list.

At the end of this paper, immediately before the Index, is appended a list of the entomological writings of the author, arranged in chronological order and numbered consecutively, to enable the student to locate the papers in which the types are described. As a further guide the numbers of the papers follow the families in the Index.
